- **Metformin:**
Metformin exerts its prevailing, glucose-lowering effect by inhibiting hepatic gluconeogenesis and improves insulin resistance.
- **Vildagliptin:**
Vildagliptin binds covalently to the catalytic site of DPP-4, eliciting prolonged enzyme inhibition. This raises intact GLP-1 levels (Incretins hormone), both after meal ingestion and in the fasting state.
GLP-1 leads to insulin secretion and inhibit glucagon secretion in a glucose-dependent manner.
